Blood clots and YOU

YOU are more at risk of developing a BLOOD CLOT after surgery or a procedure than when you take a long-distance flight.

What can YOU do to reduce your RISK?

My risk factors

Blood clots can develop in the legs and pelvis and can be dangerous if they travel through the body and block blood supply to the lungs.

Admission to hospital to undertake treatment puts you at HIGH risk of BLOOD CLOTS.

If any of the following apply, YOU are at HIGHER RISK of a blood clot.

- I am having a surgical operation or procedure
- I have had a blood clot in the past
- Someone in my family has had a blood clot
- I am a smoker
- I have cancer and/or am undertaking cancer treatment or therapy
- I have a chronic illness/blood disease
- I have varicose veins
- I am over 40 years old
- I am overweight
- I am pregnant or have recently given birth
- I am on the contraceptive pill
- I am undertaking hormone replacement therapy
- I am on steroids
- I have not been physically active (e.g. walking) recently
- I have recently taken a long-distance flight

What actions can I take to reduce my risk of BLOOD CLOTS?

Drink the recommended amount of water

Water may ensure the blood stays fluid for good blood flow. Reduced water intake could thicken the blood.

Keep active

Frequent light activity (e.g. getting up, walking around and leg exercises) helps to bring blood back from the lower legs, reducing the risk of blood sitting and clotting in the veins.

Wear compression stockings

Compression stockings reduce the diameter of the veins in the legs, improving blood flow.
Post-operative recovery plan

My recovery plan

My discharge date: _________________________________

How much water should I drink everyday for the next 8 weeks?

My activity prescription

Week 1 ........................................................................ Week 5 ........................................................................
Week 2 ........................................................................ Week 6 ........................................................................
Week 3 ........................................................................ Week 7 ........................................................................
Week 4 ........................................................................ Week 8 ........................................................................

How long should I wear my compression stockings?

Medication plan: ________________________________________________________________

Signs I should watch for

Have a raised temperature

Feeling unwell

Have sudden shortness of breath and/or feel pain in your chest

Feel pain in your pelvis

Are coughing up blood-streaked mucus

Experience pain and/or swelling in your legs

Contact your doctor immediately if you are concerned about your health or well-being or are experiencing any of the above symptoms.

Non-emergency phone contact: __________________________________________________

If you are experiencing any of the above symptoms, it is an emergency. Call the ambulance on 111 and inform them that you have had surgery and are showing signs of a blood clot.

Your checklist to:

- Complete the pre-admission risk assessment
- Ask your doctor if treatment is required
- Bring this brochure into hospital
- Before you go home, ensure you understand what to do, talk with your nurses and doctors and write up your recovery plan.

If applicable:
I understand my blood thinning medicines plan:
- Before coming to hospital
- When I go home.
